

Why You Can't Welcome With Carpet Tiles

Entrances are used by all building inhabitants on a daily basis, which means a lot of wear and tear on the flooring. Carpet tiles, though sufficient in low-traffic areas, are not designed for high-traffic and weather-affected areas, such as main entrances. Here are a few reasons why:

- As people enter a building, they can quickly develop a negative impression based on the cleanliness and appearance. That impression may remain as they evaluate the rest of the building and influence their judgment about the quality of services rendered.
- Tracked-in water and debris sits on the surface of the carpet at the entrance, creating an unattractive floor as well as a potentially slippery surface.
- Insufficient trapping of water and debris means it can be tracked further into the building, increasing facility and maintenance costs and adding to the building overhead.
- With a short life cycle due to the high amount of foot traffic, worn out carpet tiles will need to be replaced. Newly replaced tiles greatly contrast with surrounding tiles that are dirty or faded.

Construction Specialties manufactures permanent entrance flooring systems that are designed to withstand the amount of daily traffic at building entrances and are easy to clean. To learn more about these durable options that can coordinate with the interior design as well as provide an environmentally responsible alternative, contact:
