Wilshire Grand Center

Location: Los Angeles, California
Architects: AC Martin
Contractors: Benson Industries
Products: Expansion Joint Covers and Architectural Louvers
About the Project
Los Angeles’ captivating lifestyle and endless opportunities are why people gravitate to this mecca of culture and tourism in California. Adding to its appeal, the city is now home to the tallest building west of the Mississippi – Wilshire Grand Center. Located in the heart of downtown LA, this 73-story structure stands 1,100 feet tall, and includes a 900-room InterContinental hotel, five restaurants, and multi-floor, Class A office space. It also features an alluring, glass skylight, which cascades like an elevated waterfall above the entrance.

The expansion joint covers were custom segmented to follow the curvature of the glass skylight.
Design Goals
AC Martin wanted to design LA’s newest skyscraper with the public’s benefit in mind. They envisioned floor-to-ceiling glass panels extending from the foundation to simulate movement and allow natural light to penetrate the building’s interior. The team visualized glass curtains for the skylight above the entrance that incorporated customizable curves and dimensional shapes capable of bearing unpredictable structural shifts. It was important for AC Martin to use products that would provide a stunning visual to the building’s exterior as well as resiliency within the infrastructure to withstand a potential seismic event.
Results
The Wilshire Grand Center brings a new age of architectural intrigue to LA by overcoming design obstacles that were once considered insurmountable; being the tallest building in the world built on such seismically sensitive ground. The AC Martin design team designated CS architectural louvers and seismic expansion joint covers to meet the project’s complex design requirements. CS expansion joint cover panels were custom fabricated, allowing them to be incorporated within the compound curve of the glass atrium, which has become the structure’s signature element. Additionally, CS’ Boldline louvers met the desired aesthetic with their mix of bold and shallow blades painted different colors for Wilshire Grand Center’s exterior and allowed the mechanical HVAC equipment to function properly. Installed on both the podium and tower, the louver system had to be customized to fit into the curtain wall. The head-to-toe windows shimmer in the daylight and are illuminated at night, and the unique curved top transforms the city’s skyline. Wilshire Grand Center matches the energetic ambience that LA radiates and earns its place as the tallest building in history to be built on an earthquake hot zone.

The first downtown high-rise in decades to be built without a flat roof top, opening the door for architects to begin being more bold, unique and imaginative.
