1. Obtain frame protection covers, verifying the numbers of the covers correlate with the door/frame numbers.

2. Test fit the vertical protection cover. Take measurements and determine the length required for proper fit.

3. If trimming is needed, we recommend the use of a chop saw for the cleanest cut possible.

   Note: To ensure a straight cut, place supports under the ends of the frame cover. This will prevent the cover from bending downward during cutting.

4. Snap on the vertical protectors.

5. Snap on the header protection cover to the frame.

6. Install hardware and door as usual.
